

- 1. A network is made up of different devices that share the same internet connection. The internet connection comes into the network from a device called a router, which is the official name of your WiFi box.**

Draw out your home network, remember to include the router that connects the devices to the internet:

- 2. It's not just the devices that are vulnerable to cyberattack, the people who use them are too.**

Which person in your house would be the easiest to target for a cyberattack? Think about how much these people use these devices and how secure these devices are.

What information would help a hacker create an effective scam pop-up:
